

When Inflammation Ramps Up, We Double Down

Sponsored by PRN Pharmacal

No horse should have to suffer from untreated pain and inflammation, and with the options available in veterinary therapeutics, they may not have to.

Although veterinarians often turn to corticosteroids and NSAIDs to combat the chronic inflammation associated with OA, the potential adverse effects associated with these drugs limits their use in some horses. In addition, because inflammation often develops before a horse shows signs of pain, an early and proactive approach to inflammation-related issues is critical and recommended.

Meet Duralactin®. Duralactin® brand products are nutritional supplements for the long-term management of inflammation in horses. The active ingredient in Duralactin® products, MicroLactin®, is a protein concentrate. Made from the milk of hyperimmunized cows, MicroLactin® contains hyperimmune milk factor (HIMF), a specialized component that has been shown to reduce inflammation by inhibiting neutrophil migration.

In a palatable, once-daily formulation, Duralactin® has been proven to be effective in multiple in vivo and in vitro studies,

with a clinical response typically seen within 10 to 14 days of starting therapy. Duralactin® can be used alone or with other treatment modalities and provides an excellent therapeutic alternative or adjunct for patients for which other options may be limited. Duralactin® products offer a powerful new way to safely and effectively fight whole-body inflammation—and give your patients the quality of life they deserve.

Use Duralactin® products for these patients:

- ▶ Horses with chronic inflammation
- ▶ Horses that need long-term therapy
- ▶ Older horses
- ▶ Horses that do not respond to other therapies
- ▶ Horses at risk for experiencing adverse events to other therapies
